Speaker: Papa Sissokho, Illinois State University

## Non-negative Integer Solutions of Linear Equations and their Simplicial Complexes

Let  $A$  be an  $n \times m$ -matrix of rank  $n$  with integer entries. Let  $S$  denote the set of all solutions  $x$  to the equation  $Ax = 0$ , where  $x$  is a vector with nonnegative integer entries. The Hilbert basis of  $S$  is the minimal subset  $H$  of  $S$  with the property that any solution  $x$  in  $S$  can be written as a nonnegative integer combination of solutions in  $H$ . For  $n = 1$ , we recently gave a geometric characterization of the Hilbert basis  $H$ . In our quest to extend this characterization to  $n > 1$ , we introduce simplicial complexes that can be associated with the set of nonnegative solutions  $S$ . We then prove that when  $n = 2$ , the resulting simplicial complex is always “regular” in a sense that generalizes the traditional notion of regularity in graphs.
